ROAD BORING PROJECTS

In horizontal directional drilling (road boring) projects, a local contractor may be tasked with installing a new water line in a mid-sized city. HDD is commonplace to avoid digging up roads that could result in costly repairs. For projects in high-traffic areas, completing the project on a strict timeline to minimize disruptions is a key consideration.

Road boring projects require high-quality, durable, and reliable casing pipes for underground installations. However, newly manufactured pipes can become expensive and have unpredictable lead times. For situations where projects need a more affordable and readily available solution, finding an alternative pipe source becomes a priority for the contractor.

Commonly, contractors are under pressure to both complete the project on time and under budget. These same companies may be looking at expensive steel pipe prices from mills. Sourcing surplus structural-grade pipe is a convenient solution that keeps the project on track.

CPI Pipe is a wholesale distributor of new surplus and used steel pipe. When a road boring project requires durable steel casing pipe on a tight schedule, sourcing new surplus and used steel pipe can be a practical solution. Quick and efficient delivery of this readily available pipe can help save up to weeks of lead time. This expedited sourcing method can also lead to significant cost savings compared to newly manufactured pipe.

When using surplus pipe for its road boring projects, the contractor can take advantage of quick sourcing and fast delivery – and ultimately positive project outcomes and happy customers.
